## GOTx glyco-platform

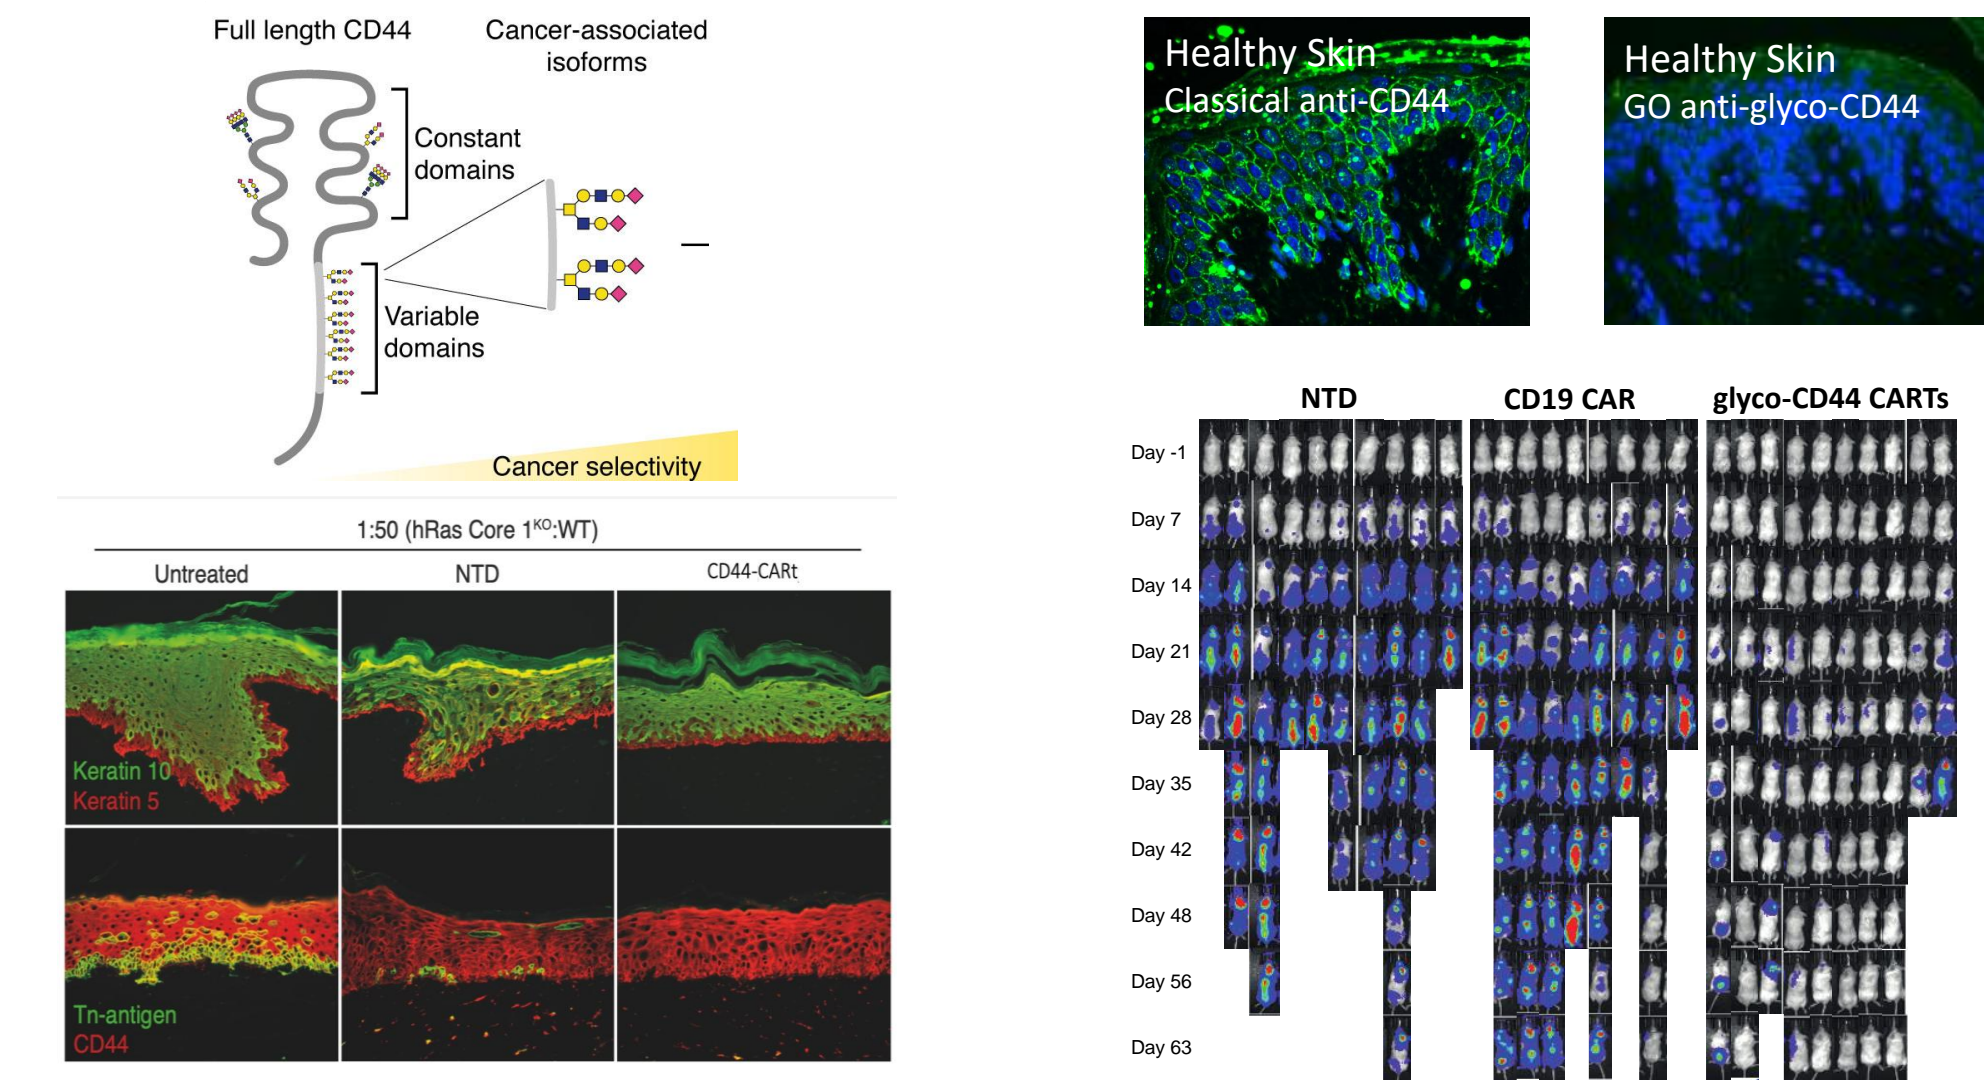

### Revitalizing classical cancer targets with novel GO glyco-targets

### Truncated O-glycans drive tumor formation

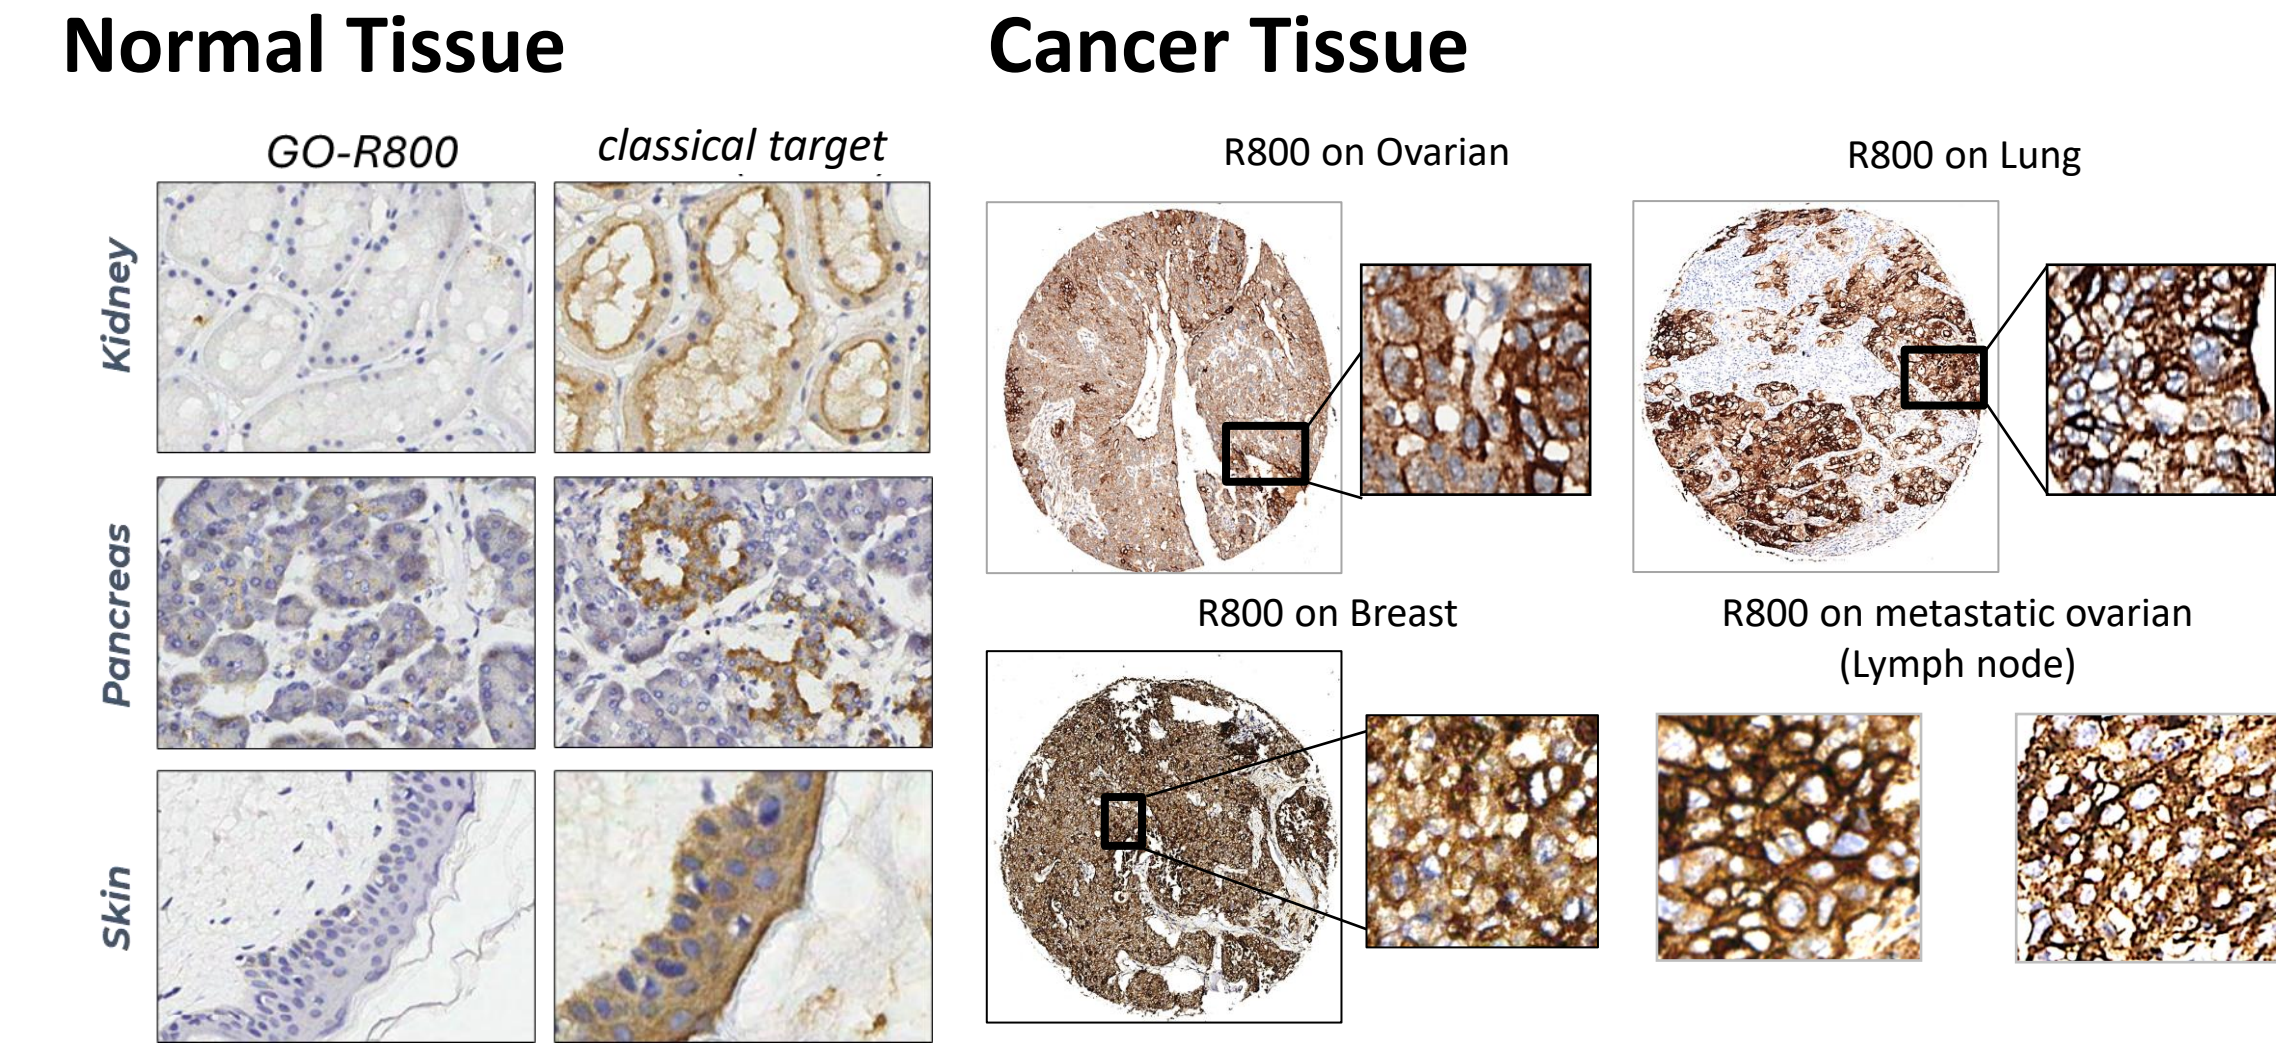

## Efficacy of glyco-CD44 GO-CARTs

CARTs derived from GO-glyco-CD44 targeting Tn-CD44 show high cancer specificity in human 3D skin models and murine CDX models<sup>1</sup>. A, Illustration of CD44. B, immunofluorescence of healthy human skin. C, Human Cancer Tissue models treated with GO-glyco-CARTs. D, Luminescence images of mice inoculated with Jurkat cells and treated with NTD, CD19, or GO-glyco-CARTs.

## GO-R800 selectively targets multiple cancer tissue

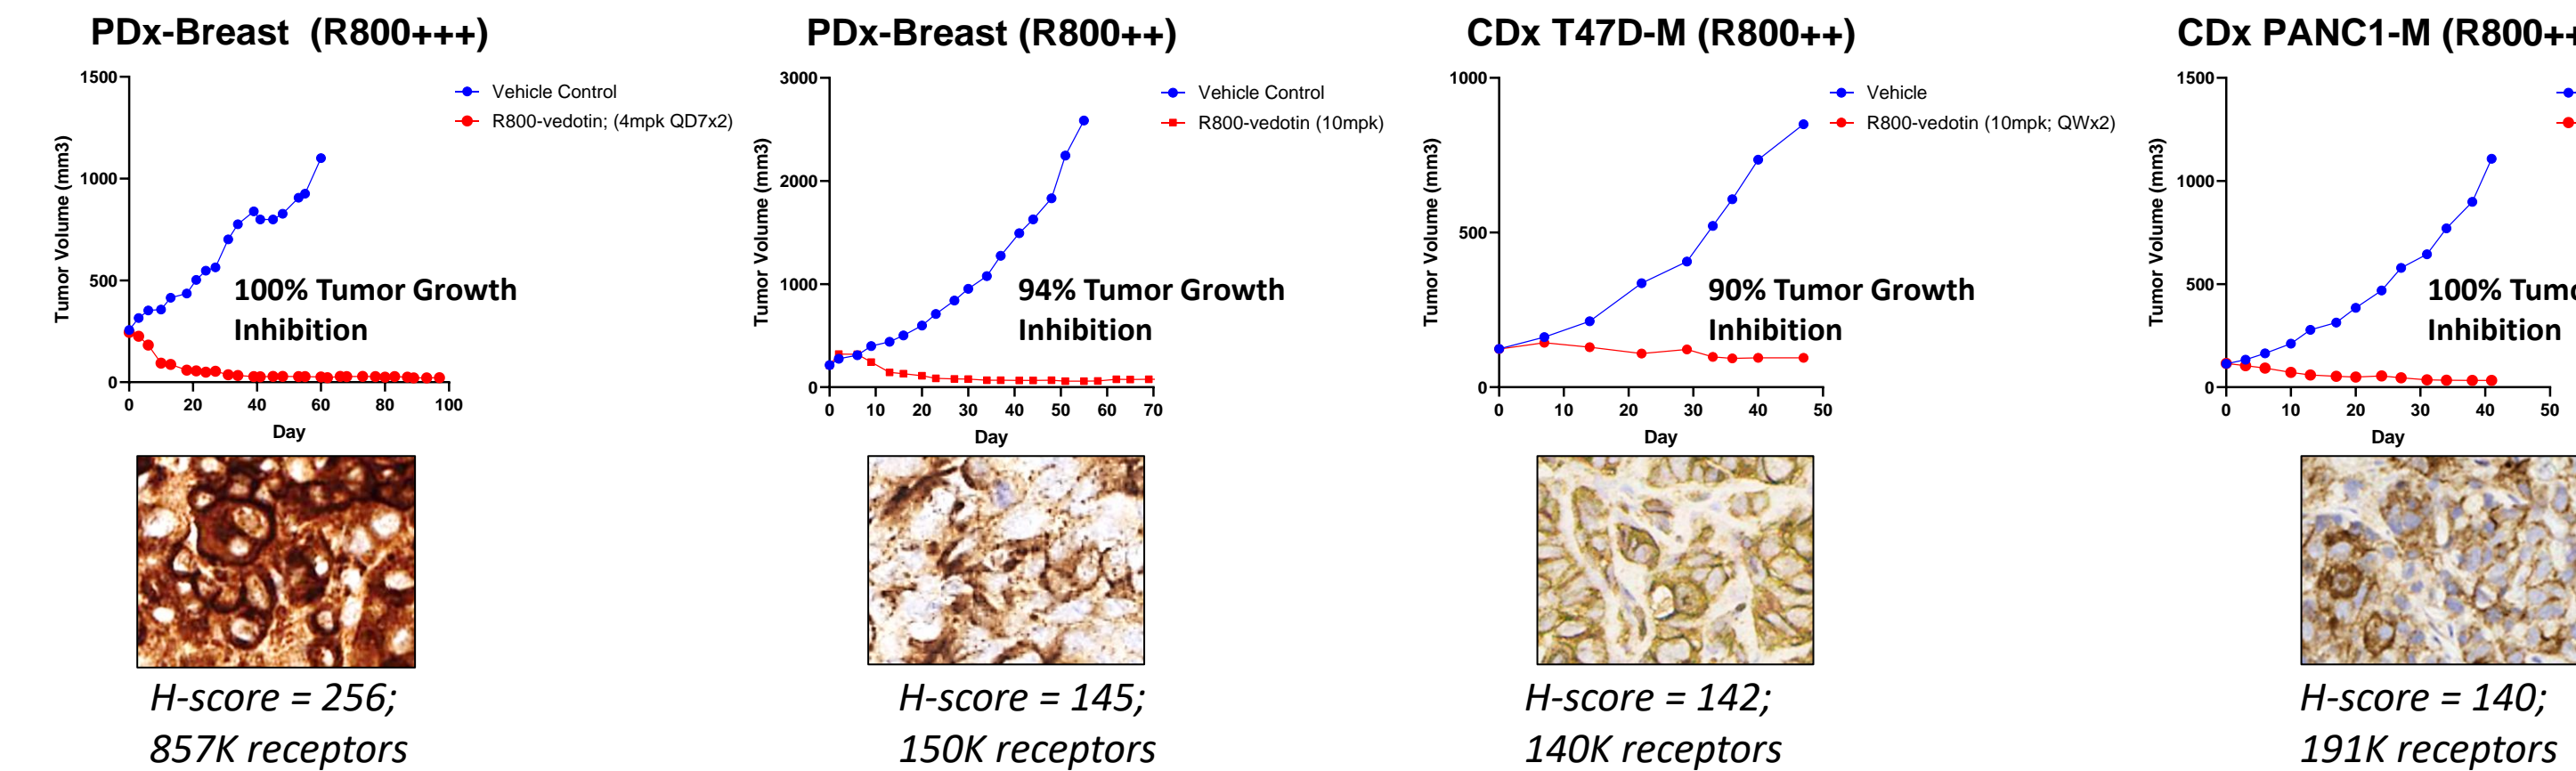

### R800 selectively binds to multiple cancer tissue

Tissue	3+/2+	1+	Total
Ovarian Cancer	19% (24/130)	30% (40/130)	49% (64/130)
Metastatic	37% (14/38)	5% (2/38)	42% (16/38)
Lung Cancer (NSCLC)	19% (26/140)	11% (15/140)	30% (41/140)
Metastatic	25% (10/40)	3% (1/40)	28% (11/40)
Breast Cancer (including TNB)	22% (16/72)	0% (31/72)	22% (16/72)
Metastatic	33% (33/104)	1% (1/104)	33% (34/104)
Normal Tissue	0% (0/96)	0% (0/96)	0% (0/96)

3+/2+ = >25% of cancers cells with positive stain; 25% cut off defined by efficacy in PDX  
1+ = 0-25% of cancer cells with positive stain

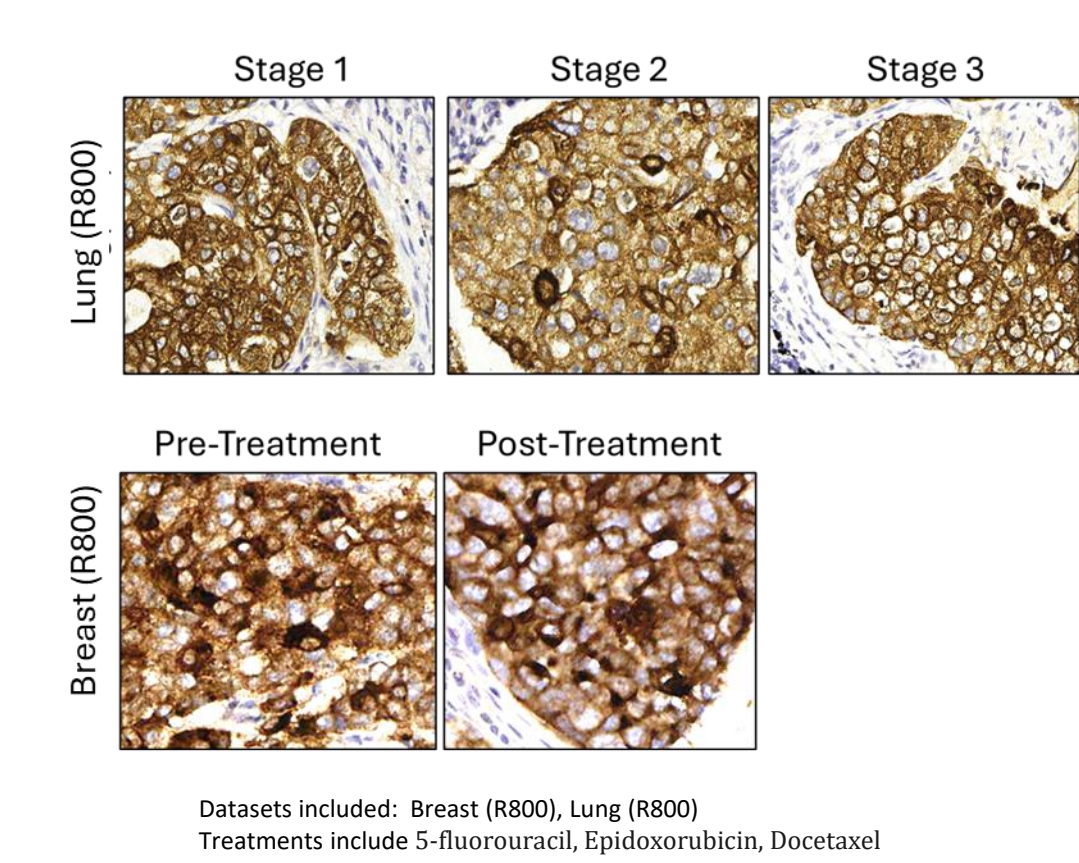

## Efficacy in PDX/CDx models R800-vedotin

### PDX/CDx models with variable R800 expression levels

Model	Target Expression	H-Score	Receptor Count	TGI
PDX-Breast	High (+++)	256	857K	100%
PDX-Breast	Medium (++)	145	150K	94%
CDx-Breast (T47D-M)	Medium (++)	142	140K	90%
CDx-Pancreas (PANC1-M)	Medium (++)	140	191K	100%

### Cancer stages and post-treatment

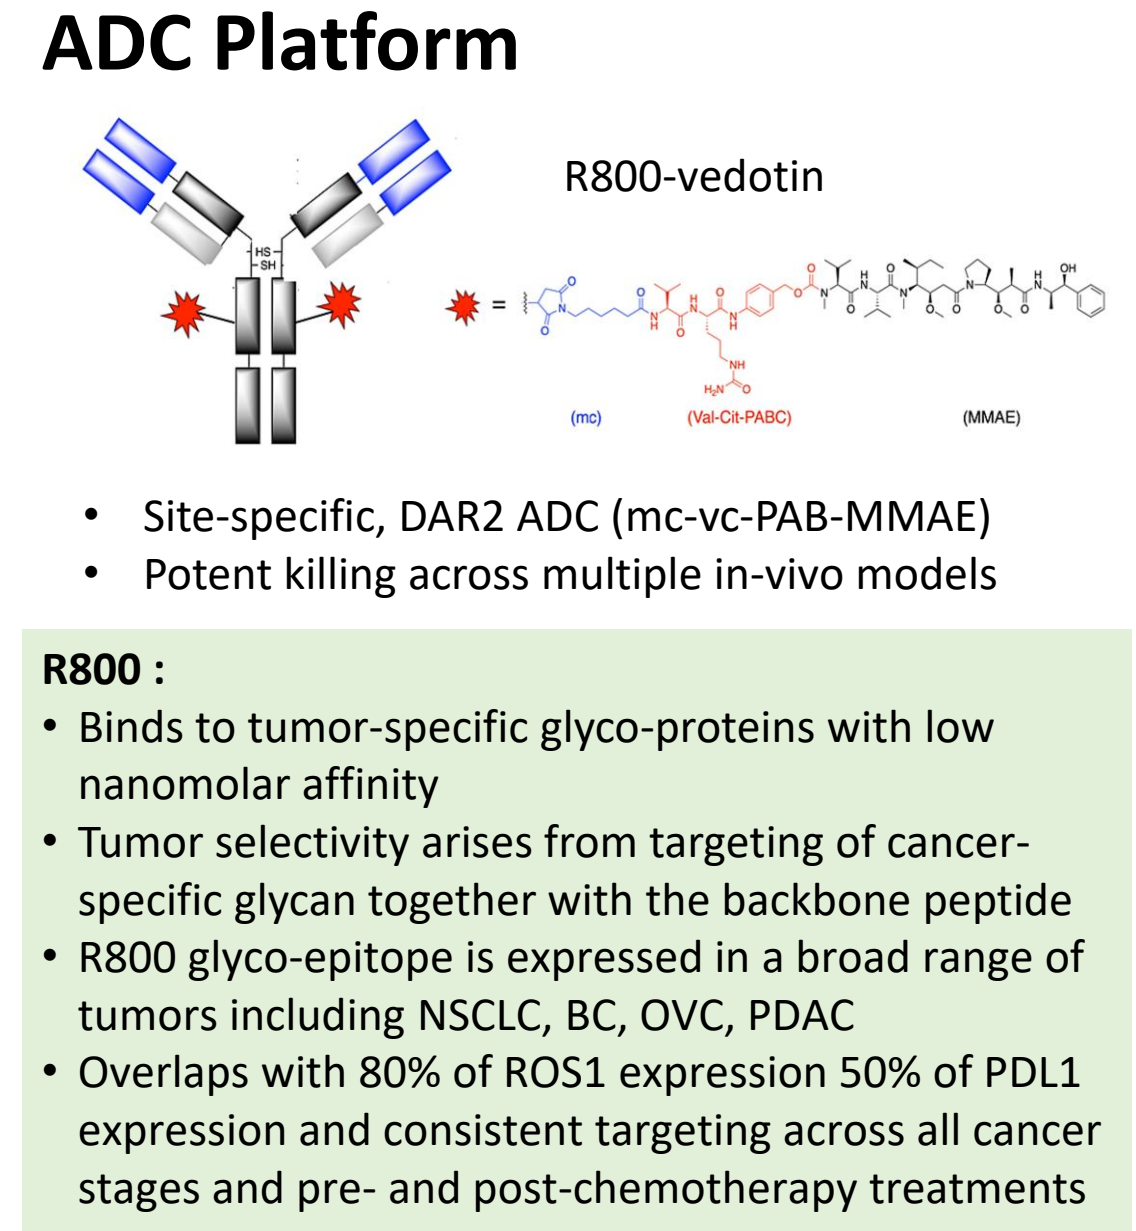

Datasets included: Breast (R800), Lung (R800)  
Treatments include 5-fluorouracil, Etoposide, Docetaxel

### Prevalence in cancer stages and after chemotherapy

## In vitro activity of R800-vedotin

### In vitro cytotoxicity

ADC	EC50	
	MCF7M	PANC1M
R800 vedotin	0.48 nM	1.18 nM

Potent activity against breast and pancreatic cancer cells.

Bystander effect in N/TERT cells analysed by Incucyte live-cell imaging. ADC kills WT-GFP target negative cells when co-cultured with target positive cells.

### Bystander killing

### Human organotypic skin tumor model

### In vitro plasma stability

Day	DAR (% of starting material)		
	Cyno	Human	Mouse
0	100	98.6	100
1	100	100	97.4
3	100	99	100
7	96.7	98	94.9
14	87.4	93.1	87.8

GO-R800-vedotin is stable in human, cyno and mouse plasma

## Summary

- GO-R800 is a Tn-glycopeptide specific antibodies with sub-nM binding affinities and exquisite cancer specificities.
- GO-R800 is selective for multiple cancer types, including triple-negative breast, lung and metastatic cancers.
- ADCs were produced using site-specific DAR2.
- MMAE was conjugated via mc-vc-PAB cleavable linker.
- R800-vedotin shows potent activity in vivo (MED ~3-4mg/kg).
- Tn-CD44 mAb is selective for multiple cancer, including head and neck cancer and shows efficacy in vivo and safety in human 3D cancer tissue models
